MSME financial tracking & microloan readiness

Research-led system concept | Updated 3 November 2026

Research question

How could clearer income, expense, and cash-flow records help an MSME owner understand their financial readiness?

Method and scope

Proposed approach: map financial-record workflows, prototype a tracking dashboard, and evaluate whether intended users can interpret the summaries. This is a proposed evaluation plan, not a report of completed participant research.

Documented contribution

The portfolio concept organizes income and expense tracking, cash-flow summaries, business profiles, and readiness indicators into a possible web-system workflow.

Current evidence and findings

No participant findings, loan eligibility outcomes, or validated readiness scores are published. The project remains a concept/prototype in this portfolio.

Publication scope

Newly prepared from the existing portfolio concepts and public project implementation. This is not a published paper, approved manuscript, or completed participant-study report. No participant data is included.

MSME inventory & consumer access

Capstone concept | Updated 3 November 2026

Research question

How could inventory visibility and product availability information reduce uncertainty between local businesses and consumers?

Method and scope

Proposed approach: map stock-update and product-discovery tasks, prototype business and customer views, then evaluate task completion and clarity with intended users. No completed study is asserted.

Documented contribution

The portfolio concept connects product records, stock alerts, availability status, customer-facing information, and administrative summaries.

Current evidence and findings

No measured sales gains, customer adoption, or completed usability-study findings are published. The current contribution is the documented system concept.

Publication scope

Newly prepared from the existing portfolio concepts and public project implementation. This is not a published paper, approved manuscript, or completed participant-study report. No participant data is included.

HydroAlert river awareness

Public simulation prototype | Updated 3 November 2026

Research question

How can an interface explain upstream observations, downstream context, and field reporting while keeping simulated data clear?

Method and scope

Implementation review of the public prototype: inspect monitoring, community, and field-report flows; identify labels distinguishing synthetic readings and local storage. This is an interface review, not a validated hydrology study.

Documented contribution

The public prototype connects scenario controls, synthetic station readings, a community view, and browser-local field reports. Its architecture and data model are documented in the system-design collection.

Current evidence and findings

Observable result: separate views and local report persistence are implemented. No flood-prediction accuracy, warning lead time, sensor validation, or community-impact result is claimed.

Publication scope

Newly prepared from the existing portfolio concepts and public project implementation. This is not a published paper, approved manuscript, or completed participant-study report. No participant data is included.
